

Fatigue is one of the big three killers on our roads

In 2012 more people in NSW died in fatigue-related crashes than drink driving crashes

Stop Sleep | Drive Safely

Worn on just two fingers, the patented StopSleep® device detects loss of concentration and fatigue.

8 MEASURING SENSORS

The award winning StopSleep® device uses 8 measuring sensors to constantly monitor and analyse skin conductivity. Prior to micro sleeps occurring, StopSleep® uses an escalating combination of vibrations and loud alert tones to warn the driver that it is time to stop, revive and survive.

Alerts drivers before a micro sleep occurs

This is the same technology used in lie detector polygraphs.

StopSleep® - Drive Safely
